Supplementary Figure 1. (A) Correlation between the relative levels of miR-595 and miR-1246 in the sera of patients with active CD and UC. The relative levels of miR-595 and miR-1246 in the sera of patients with active CD and UC were plotted against each other, and a Spearman’s correlation coefficient determined. (B) Box-whisker plots of the combination of the relative quantities of miRNAs miR-595 and miR-1246 in the sera of patients with active colonic CD (aCD), active UC (aUC), and of healthy control subjects (HC). The bottom and top of each box represent the 25th and 75th percentiles, the whiskers represent the minimum and maximum values, the middle band is the median and the horizontal bar is the mean.
