Appendix 1. Absolute changes of (A) platelet counts, (B) lactate dehydrogenase (LDH), (C) serum aspartate aminotransferase (AST), and (D) alanine aminotransferases (ALT) levels over time according to treatment group. Absolute variations were calculated as the difference between values at the predetermined times and values at baseline determined just before the first injection. Red bars indicate the methylprednisolone group and blue bars indicate the placebo group. Comparison between methylprednisolone and placebo: *P<.05. Women receiving methylprednisolone had a significant greater increase of platelet counts than women receiving placebo both 6 hours after the first injection and 24 hours after. Data are means and standard errors.
High-dose methylprednisolone on early thrombocytopenia in preeclampsia: a randomized controlled trial. Obstet Gynecol 2016;128.
