As seen above in Figure 7, the dialogue box carries the user through the management of ADHF in the ED. Built into the decision guides is the option for **step 3: MD reassessment and 2nd trial treatment order sets**, displayed in figure 13 and provides options for aggressive medical management in the ED setting.

If the patient’s condition warrants immediate pharmacologic management, the pathway guides users to a clinical decision menu for **treatment of Severe HF** (figure 8). This is based on ACLS guidelines and incorporates use of vasodilators, inotropic infusions, diuretics and respiratory orders.
