Prevalence of $\geq 10^\circ$ and $\geq 30^\circ$ of elbow flexion contracture (EFC) according to age. The prevalence of contracture of $\geq 10^\circ$ increased significantly with age ($p < 0.001$).

Prevalence of $\geq 10^\circ$ and $\geq 30^\circ$ of elbow flexion contracture (EFC) according to the Narakas classification (groups I, II, and III). The increase in the prevalence of contracture of $\geq 10^\circ$ with increasing brachial plexus involvement was not significant.
