UNDERSTANDING ADVANCE HEALTH CARE DIRECTIVES (AHCD)

By Maureen Kroning, EdD, RN

Goals & Objectives

• Participants will increase their knowledge about AHCD

• Review AHCD documents used at the hospital

• Role play a AD scenario

Why would someone need to do this?

She said: "I probably should have had it dated, too,"
It's a matter of fighting not so much for life, but for a dignified death.

Agency Health Research Quality (AHRQ) research findings

- Fewer than 50% of terminally ill patients had AHCD in their medical chart

- 12% of patients with AHCD received participation from their physician

- Among 65 and 76% of physicians were unaware that their patient had AHCD
AHRQ research findings

- Having AHCD in the medical chart did not add to documentation in regards to patient preference
- AHCD assisted in making end-of-life decisions in fewer than half of cases when an AHCD was present
- AHCD were found most times not applicable until the patient was incapacitate and without hope of cure

AHRQ research findings

- Healthcare providers & patient surrogates had trouble knowing when to terminate medical treatment & frequently waited until the patient was on the verge of dying before AHCD were enforced
- Terminology in AHCD most times was nonspecific and general thus not providing understandable instruction
- Surrogates named in the AHCD were often not present to make decisions or were too emotionally distraught to offer direction

AHRQ research findings

- 65% of the time physicians were found to interpret patients AHCD incorrectly
- Family members acting as patient surrogates were found to formulate guesses which created errors or even overtreatment even if the AHCD has been reviewed and discussed with the patient
Patient Self-determination Act (PSDA)

- Mandates competent adults when admitted to the hospital receive in writing their right to accept or refuse medical treatment & the right to use AHCD.
- Requires ADs be documented in patient records.

PSDA

- Does not require states to recognize living will & durable power of attorneys for healthcare.
- Requires health care facilities train staff members about AD.

What are AHCD?

- Legal documents that allow people to exercise their right to accept or refuse medical care even when they are no longer able to.
- The NY state law defines “a qualified patient” as someone.....
AHCD

• NY state law permits a person to issue a declaration directing a physician to withhold or withdraw treatment

• This includes artificially administered nutrition & hydration in the event the person becomes terminally ill or no longer able to make decisions regarding medical treatment.

What is included in AHCD?

• A Living Will
  • A living will can include: A Do not Resuscitate (DNR) order or even a Do Not Intubate (DNI) order.
  • A Healthcare Power of Attorney
  • A Healthcare Power of Attorney can also be known as: a health care proxy, a surrogate, representative or a durable healthcare power of attorney.

A Living Will

• A Living Will is a legal document, recognized in NY, that communicates to your healthcare provider what medical care you want or do not want in the event that you are too ill or incapacitated.

• This document gives you the right to accept or refuse medical care. You do not need both a living will and a durable power of attorney for your end of life wishes to be honored.
Healthcare Power of Attorney

• Legal document, that allows you to give the name of someone you trust to make health care decisions for you in the event you are no longer able to.
• This person/agent can make decisions for you only after your doctor has determined that you are unable to do so.
• If the seriously ill person does not have family or friends & has not said what they would want, the orders of two attending doctors are necessary to stop life-sustaining treatment. This does not require legal permission.

Healthcare Power of Attorney

• This person must be a competent & 18yrs or older
• This does not have to be notarized.
• People can revoke this if they have decision-making capacity.
• The durable power of attorney for healthcare takes precedence over a living will under NY law.
• NY law specifies who can act as a health care proxy for minors.

Do Not Resuscitate (DNR)

• A DNR is a legal order that tells your healthcare provider that you do not wish to have Cardio Pulmonary Resuscitation (CPR) if your heart stops beating or you stop breathing.
• It is important to tell your doctor or nurse if you have a DNR order.
• You may decide at any time to add a DNR order to your living will.
Do not Resuscitate (DNR)

- It is important to understand that having a DNR order does not mean that you will not receive medical treatment while in the hospital.
- You can determine what types of treatments you want or do not want.
- Please remember to be as specific as possible by putting your wishes in writing to avoid any confusion.
- Out-of-hospital DNR can prevent unwanted aggressive life sustaining treatment by EMS.

What could a DNR mean?

- If you stop breathing (respiratory arrest) or your heart stops (cardiac arrest) you will not receive: chest compressions, respiration, intubation, ventilation, defibrillation, or resuscitation medications. However, you should be specific to what you want or do not want.
- If your heart does not stop or you do not go into respiratory arrest you will still be treated for any injuries, pain and difficulty with breathing, bleeding and other medical conditions.

Do Not Intubate (DNI)

- You may decide you want CPR but do not want to have an endotracheal tube inserted. This is what a DNI means.
- A DNI has to be clearly stated in your living will.
- A DNI must be put in writing so that your doctor and nurse can follow your wishes.
FYI
• Healthcare providers are granted legal immunity if they carry out the provisions of an AD according to NY law.

• Healthcare providers can not be prosecuted for refusing to carry out patients wishes if they think that ethically the patient should receive the treatment.

FYI
• NY does not recognize AD executed in another state
• A pregnant women’s AD can be put into effect as long as it is compliant with NY state law.
• Anyone over age 18 other than the patients child, spouse or physician can witness an AD.

We need to teach our patients about medical treatments to consider
• Cardio Pulmonary Resuscitation (CPR)
• Endotracheal/tracheal Intubation
• Ventilator
• Oxygen Therapy
• Dialysis
• Tube Feedings
• Donation of Organs and/or Tissues
Cardio Pulmonary Resuscitation (CPR)

- Cardio Pulmonary Resuscitation (CPR)
- Is an emergency procedure.
- The chest is compressed manually.
- The compressions send oxygenated blood to the heart and brain.
- Assisted breaths may also be done to put air into the lungs.
- CPR helps prevent cell death and brain damage.

How effective is CPR?

- Studies show variation in CPR effectiveness depending on whom and where it is performed as well as the age of the patient.
- Studies show CPR alone results in few complete recoveries and serious complications may develop as a result.
- If your heart stops, CPR should be started as soon as possible. If you do not wish to have CPR make sure you have this in writing.

Endotracheal Tube

- Placement of an endotracheal tube is called intubation.
- A flexible plastic tube is inserted into your trachea through the mouth.
- This tube is placed into your trachea (windpipe) to keep your airway open.
- The endotracheal tube can be used to both administer oxygen and certain medications.
Endotracheal Tube

• The tube will be secured to the face and connected to an oxygen source, such as an ambo bag or a mechanical ventilator.

Complications associated with an endotracheal tube

• Complications can be minor, severe, long-lasting and even permanent.

• Some of the complications that can occur include: vocal cord damage, esophageal tear, nerve damage and fluid in the lungs.

A Ventilator

• A ventilator is a machine that attaches to the airway tube to move air into and out of the lungs if you are unable to breathe or breathing insufficiently. This is called mechanical ventilation.
Complications of Mechanical Ventilator

- Pneumonia is both a common and serious complication.
- Sinus infection
- Air leaking into the space between the lungs and chest wall and air being pushed into the lungs with too much pressure can cause the lungs to collapse.
- High levels of oxygen can damage the lungs.
- Damage to the vocal cords as a result of the breathing tube.

Oxygen Therapy

- Oxygen is needed for every cell in your body to function.
- Complications of O2 Therapy:
  Dry and/or bloody nose, skin irritation from the nasal cannula or face mask, fatigue, morning headaches

Dialysis

- A Dialysis machine takes away waste and excess water from the blood and is used when the kidneys fail to function properly.
- Complications of Dialysis: Access complications, heart disease, vascular disease, fluid overload & malnutrition
Enteral Tube Feedings

- Feedings administered into the intestine to ensure adequate nutrition.
- Administered through tubes such as: nasogastric, small-bore, gastrostomy or jejunostomy.
- Complications: gas, bloating, cramping, air in the tube, diarrhea, nausea, vomiting, constipation, aspiration & metabolic

Donation of Organs and/or Tissues

- Removal of healthy organs/ tissues from one person for transplantation into another.
- It is estimated that one donor can save or help up to 50 people.
- You can donate: kidneys, heart, liver, pancreas, intestines, lungs, skin, bone and bone marrow and cornea.
- Let your family/healthcare providers know your wishes.

Five Wishes

- Five Wishes is a US National Advance Directive that was created by an organization called Aging with Dignity.
- This directive considers not only your medical wishes but your spiritual needs as well.
- The first two wishes are part of your AHCD.
Wish 1
• Wish 1: Who do you want to make health care decisions for you if you cannot?
• Think about the following:
  • Do you want a healthcare proxy?
  • If you want a healthcare proxy, who do you want to speak for you in regards to your medical care?

Wish 2
• Wish 2: What kind of medical care do you want or do not want?
• Think about the following:
  • Did you include what medical care you want or do not want in your living will?
  • Were you specific about what medical treatments you want and do not want?
  • Do you want a DNR order or a DNI?

Wish 3
• Wish 3: How comfortable do I want to be?
• Think about the following:
  • What type of pain management do you want?
  • What grooming and bathing instructions do you have?
  • Do you want hospice care?
Wish 4

• Wish 4: How do you want people to treat you?

• Think about the following:
  • Do you want to be at home?
  • Do you want someone praying beside you?

Wish 5

• Wish 5: What do you want your loved ones to know?

• Think about the following:
  • How do you want to be remembered?
  • What final wishes do you want such as: a funeral and any special memorial plans

FYI

• If an adult patient lacks decision making capacity and does not have a surrogate decision maker, health care providers do not need to seek legal permission to stop life-sustaining treatment.
Common Question

• If I have a non-hospital DNR does this count in the hospital?
• Yes, according to NY Department of Health, a non-hospital DNR is treated the same as a hospital DNR until the attending doctor can examine you. It is not necessary for additional consents to be given. The doctor can order a hospital DNR.

Common Question

• If I am transferred to another healthcare facility will my DNR be recognized?

• Yes, when transferred, the hospital will give EMS personnel the DNR order so that they in turn will give it to the healthcare facility you are transferred to.

Encourage and ask your patient:
What questions do you have?

• It is important you discuss all questions with your nurse and doctor. Remember your nurse is your advocate and can help make sure all your healthcare wishes are followed.
