Supplementary Figure 3: Scar assessment using the physician and patient photoguide. A photoguide of five scars with a range of severities (see below) was used to rate a patient’s scar. The photos were categorized as minimal, mild, moderate, severe, and very severe, with corresponding scores of 1 to 5.

Photonumeric Guide Instructions to Patients

A card with a window has been placed over a section of your scar. You should provide a rating of how your scar looks by focusing only on the area that is visible in the window.

Looking only at the area within the window, please use the photographs in the booklet. Even though your scar may not exactly match any of the photographs in the booklet, please pick the picture that most closely looks like your scar and record that number below (Please mark ☑ in one box only).
