Fat grafting is often used for nasal augmentation and to reverse age-related changes to nasal structures.

**Pyriform atrophy:**
Age related changes of nasal structures

**Injectable Tissue Replacement (ITR²) Fat Grafting Steps:**

1. Pyriform injection
   - (C shape fashion)
   - Raises nasal base

2. Columella injection
   - (Fill medial crura columns)
   - Strutting & tip elevation

3. Nasal dorsum
   - (Glabella injection)
   - Symmetry/smoothing

Use of fat as a natural nasal filler provides long-lasting effects up to 1.5 years after the procedure.

**ITR² is a novel reproducible fat grafting approach with moderate-to-high satisfaction rates among patients.**

Treatment of Nasal Aging and Possible Long-term Nasal Enhancement With Fat Using Injectable Tissue Replacement
