

Supplementary Figure e-1. AUROC analyses for preclinical AD

AUROC analyses for the ^{18}F -AV-1451 signal from the tau stage region I-IV, tau stage region I-V, CSF T-tau and P-tau, hippocampal volume and temporal lobe cortical thickness, to differentiate prodromal AD (panel A) and AD dementia (panel B) from preclinical AD. AUROCs are shown in the legends. AUROCs for hippocampal volume were adjusted for intracranial volume. Significant differences are described in the supplementary text section.
